1. (18 pts) On the website <a href="www.listsofjohn.com">www.listsofjohn.com</a> it is reported that there are 59,817 ranked peaks in Alaska. I took a random sample of 8 peaks and found a sample mean elevation of 4,029.1 ft. and a sample standard deviation of 2,329.8 ft. Give a 95% confidence interval for the mean elevation of all 59,817 peaks.

2. (19 pts) Data given are 4 pairs of games CMU men's basketball played home and away against the same teams. At the 1% significance level can we conclude any different any difference in points scored on average at home and away for all possible games CMU men's basketball team could play?

Team Played:	NM Highlands	Adams State	Western	Ft. Lewis
Points Scored by CMU at Home:	96	83	86	89
Points Scored by CMU as Visitor:	84	90	78	80

S V1S1tor:		
H <sub>0</sub> : H <sub>a</sub> :		
Critical Value(s):		
Test Statistic:		

Yes/No Answer:

3.	(12 pts) Suppose somebody else with different data for the previous problem ad gets a test statistic of
	t = 1.250. Give their p-value and say what it means in everyday terms.

4. (19 pts) Data was collected from samples from the website www.listsofjohn.com for how many people had climbed peaks in Mesa County and Garfield County. At the 5% significance level can we conclude that Mesa County peaks are climbed more on average than Garfield County peaks on this website?

	Sample Mean	Sample Standard Deviation	Sample Size
Garfield County	5.4	3.050	5
Mesa County	8.0	8.188	8

			201141011	
	Garfield County	5.4	3.050	5
	Mesa County	8.0	8.188	8
$H_0$	:			
$H_a$	:			

Critical Value(s):

**Test Statistic:** 

Yes/No Answer:

- 5. (8 pts) Suppose somebody else collects data for #4, what is the chance they won't conclude Mesa Peaks are climbed more when in fact they are?
- 6. (8 pts) Suppose somebody else collects data for #4, what is the chance they will conclude Mesa Peaks are climbed more when in fact they are not?

7.	(21 pts) So far this year CMU baseball player Keenan Eaton has got 17 hits in 42 attempts. Treat this as a random sample and give a 95% confidence interval for the percentage of all attempts that will result in hits (i.e., what his batting average will be at the end of the season).
8.	(17 pts) So far this year CMU baseball players Keenan Eaton has got 17 hits in 42 attempts and Reagan Todd has got 11 hits in 38 attempts. At the 10% significance level, can we conclude any difference in their hitting percentage for all possible attempts?
	$H_0$ :
	$\mathrm{H}_a$ :
	Critical Value(s):
	Test Statistic:
	Yes/No Answer:
	The rest are worth 1 point each.
	If H <sub>0</sub> is true what is the probability that you will reject it by mistake?
10.	If H <sub>0</sub> is not true what is the probability that you mistakenly not reject it?

- 11. If you mistakenly don't reject  $H_0$ , what type of error is it?
- 12. What is the chance of making a type I error?
- 13. What is the notation for the total area of the rejection region?
- 14. The edge(s) of the rejection region(s) are called what?
- 15. Are the critical value(s) found by a table or calculation in this class?
- 16. Is the test statistic found by a table or calculation?
- 17. What is the area under a *t* curve?
- 18. To figure the sample size, *n*, needed for a CI for proportion, if you have a reasonable value for *p*' and use it then your CI may have a margin of error a little too big, but your sample size will be \_\_\_\_\_ making collecting the data easier.
